Laravel E-commerce Project Setup and Run Instructions

Prerequisites:

- PHP version >= 8.1
- Composer
- MySQL
- Node.js and npm

Installation Steps:

1. **Clone the Repository:**
- Download the project from GitHub: https://github.com/Jalismahamud/Laravel-ecommerce.git
2. **Install Dependencies:**
- Use Composer to install PHP dependencies.
- Use npm to install Node.js dependencies.
3. **Configure Environment:**
- Copy the .env.example file to .env.
- Update the .env file with your database and other environment-specific settings.
- Generate an application key.
4. **Database Setup:**
- Run migrations to set up the database schema.
- Optionally, seed the database with initial data.
5. **Build Frontend Assets:**
- Compile CSS and JavaScript assets using npm.

Running the Project:

1. **Start the Development Server:**
- Use php artisan serve to start the Laravel development server.
2. **Access the Application:**
- Open your web browser and navigate to http://localhost:8000 to view the application.
